Problem Set 9 Solutions 5 Part (a) implies that a tournament has a cycle cover of size at most  $k$  if and only if it can be turned into an acyclic tournament by reversing directions of at most  $k$  edges. We will use this characterization for the kernel. We give two simple reduction rules:

Control engineering is based on the foundations of feedback theory and linear system analysis, and it integrates the concepts of network theory and communication theory. Therefore control engineering is not limited to any engineering discipline but is equally applicable to aeronautical, chemical, mechanical, environmental, civil, and electrical.

### **Chapter 21: RLC Circuits**

PHY2054: Chapter 21 19 Power in AC Circuits  $\hat{P} = I_{rms} V_{rms} \cos \phi$  is the "power factor". To maximize power delivered to circuit  $\Rightarrow$  make  $\phi$  close to zero. Max power delivered to load happens at resonance. Eg, too much inductive reactance ( $X_L$ ) can be cancelled by increasing  $X_C$  (eg, circuits with large motors) 2  $P_{ave} = I_{rms}^2 R = I_{rms}^2 \cos^2 \phi$

### **MATH 304 Linear Algebra Lecture 16: Basis and dimension.**

Basis Definition Let  $V$  be a vector space. A linearly independent spanning set for  $V$  is called a basis. Equivalently, a subset  $S \subset V$  is a basis for  $V$  if any vector  $v \in V$  is uniquely represented as a linear combination  $v = r_1 v_1 + r_2 v_2 + \dots + r_k v_k$ , where  $v_1, \dots, v_k$  are distinct vectors from  $S$  and
